

## My child had COVID. Should they get vaccinated?

Getting vaccinated adds another layer of protection. Even if your child has had a previous infection, the vaccine acts as a booster that strengthens the immune response.

There have been reports of people getting infected with COVID-19 a second time, which makes getting vaccinated even more important.

Protection from the vaccine is stronger than protection from the infection.

Getting vaccinated protects against variants that are now circulating.

If your child is currently infected with the virus or experiencing symptoms of COVID-19, they should wait to get the COVID-19 vaccine. Talk to your child's healthcare provider for more information.
